KeeperX

## A full stack web app for note keeping

Presentation and Development by Misha Smirnov

Features:

- Sleek and intuitive user interface

- Persistent notes that stay saved between all devices

Backend & Deployment

Uses node.js alongside mongodb (atlas), and uses router and express for API calls.

Deployed on heroku. Link:

https://keeper-7daf02ba7272.herokuapp.com/ (notes found on /notes

Learning Experiences

This was my first time ever building a full stack web application. Most of the things I did in the project were a first for me, such as deploying on heroku, making a node.js backend and using it for routing, or making models for mongoDB. This was also my first time using mongoDB, which is a lot more simple than mySQL, but was hard to get working at first. Having this first experience, even though it was difficult and rough, is really valuable, as it means that next time I need to set up any of those services I'll have a much easier time
